Smart Buildings

- Building Automation
- Room Management
- Smart Touch Switches

VDA was established in Italy in 1980 as group of specialists involved in technological developments across various sectors, from the construction industry to the industrial industry. The company's identity and mission over the years progressively focused on the specific sector of building management systems for hospitality, developing and producing hardware and software for the Room Management System market.

Micromaster is the room management system created from VDA, with precise objectives:

- to integrate a unique room system, to include all the electrical and mechanical features of the room, to give the guest comfort and user-friendly technology;
- to improve the internal management by the hotel staff, thanks to an easy-to-use supervision software that provides all information on room status, room access and room climate;
- to simplify the cabling, installation and maintenance of the systems.

From the end of the last century, VDA expanded into a new market, the **BMS (Building Management System)** sector. So the room automation of the hotel expanded from the bedroom to the entire building, to guarantee a better use and management of all the areas and technological features available within the building. Over the years, VDA has been providing a more and more complete package, thanks to a team of specialists that from 2003 have been analysing and resolving the issues surrounding the BMS system, giving the Client total automation of the building. The VDA offer today covers also Interactive Television, providing IPTV and Guest Wifi.

Vitrum is a union of technology, innovation and design, a smart switch collection for room control. A unique and revolutionary concept that transforms the traditional switch into high technology designed objects for home automation. A light ring, a glass surface, your hand.

Three simple and harmonious things that offer you an unprecedented sensorial impact. The great attention to detail that characterise Vitrum, together with the most worldwide used protocols – Modbus, Z-Wave and KNX – makes Vitrum a simply inimitable product.

Vitrum Smart Touch Switches

Today Building Automation involves more and more aspects of the building, extending to different hotel features, for example using lighting features to decorate the bedrooms, the public areas, and also external walls.

To satisfy this new market VDA extended the Vitrum range through our Smart Switches, using Smart panels for lighting, access and temperature control. The switches were developed using the Vitrum aesthetics, and perfectly integrate with the Micromaster technology. Today VDA redeveloped the entire Vitrum Smart Switch collection to bring it also into the residential market, making them independent from the Micromaster system. The continuous process of development, innovation, implementation and optimisation, transformed this family business into an important group that now enjoys leadership within the Room Management System world for hospitality.

The company designs and manufactures all of its own key components and software, providing international certifications, as well as country specific ones. VDA also produces complex customised solutions that are able to satisfy almost any request or need.

VDA Group has installed and maintains more than 1,800 systems across 190,000 rooms, across four different Continents, in many prestigious locations, working with worldwide hotel chains such as Hilton, Kempinsky, Hyatt, Rocco Forte, and Park Plaza, and big hotels such as MGM Macau.
